

Konvert

Your Smart Sales Engine

Your Smart Sales Engine

An AI-powered sales management and tracking platform built for multi-tier enterprise teams — streamlining distribution workflows and giving Pakistani businesses a secure, locally hosted alternative for data-driven decision-making.

Founding Team:

Almashreq Soft

Prepared For:

Prospective Clients

Summary

Konvert is an AI-powered system that runs your whole sales operation — from the rep in the field to the CEO's desk. No matter how many layers your team has, everyone works from the same accurate, up-to-date picture, updated in real time.

It uses AI to forecast performance and tracks your team's routes live, so routine sales tasks run on their own and managers spend less time chasing updates and more time coaching. It's built to grow with you, whether you're a small company or a large enterprise, and the goal is simple: get more return from what you already spend running your sales operation.

Section 1

Introduction

1.1

Motivation

Even businesses with excellent products often hit the same wall: the sales management tools on the market are either expensive foreign platforms or clunky legacy systems that take months to learn. This problem shows up in the numbers too – industry research shows field reps can lose a fifth or more of their week to admin and manual data entry instead of selling. That's momentum businesses can't afford to lose while they're trying to grow.

On top of that, relying on foreign-hosted software means sensitive sales data – customer lists, pricing, order history – sits on servers outside the country, with little local support if something goes wrong. Without a secure, easy-to-use, locally built alternative, businesses are left choosing between keeping their data close and keeping their operations efficient. Pakistani businesses need a solution that lets them do both, without the cost or complexity of importing a foreign platform.

1.2

Project Overview

Konvert is a single, AI-powered sales platform that connects what's happening in the field with what leadership sees on their dashboards – built to be the operational backbone for Pakistani enterprises.

Where older tracking tools are reactive and slow to update, Konvert closes the gap between mobile field work and the web systems your business already runs on. It's built to handle organizations with up to eight management tiers, so the moment a sales rep logs a visit on the road, it's visible on the right dashboard – no waiting, no re-entry. By connecting directly to your existing systems, including the Almarshreq infrastructure, Konvert removes the data silos that create blind spots and gives the whole organization one real-time, trustworthy source of truth.

At its core, Konvert uses machine learning to turn field activity into forward-looking insight — live route tracking, automated tour planning, and AI-driven performance forecasting that help you catch problems before they cost you money, instead of after. The platform is built to scale, from a growing startup to a large distributor with hundreds of reps in the field, automating routine sales tasks and cutting operational costs along the way. And because it's built and hosted locally, your commercial data stays under your control.

1.3 Problem Statement

Pakistani enterprises are stuck between two bad options: outdated regional systems that don't keep up, and global software giants priced far beyond local budgets.

Depending on fragmented, foreign, or legacy software leaves real gaps in data accuracy, security, and day-to-day oversight. Businesses are left choosing between two flawed paths:

On one side,

regional platforms like SanSFE come with a clunky user experience and no real

On the other hand,

world-class platforms like Salesforce or HubSpot are priced out of reach and built

synchronization with central systems like Almarshreq, so data gets lost or delayed

with far more complexity than most local teams need.

This gap between what's happening in the field and what head office sees is a well-documented industry problem: SPOTIO's 2026 State of Field Sales report found reps typically lose a fifth to a quarter of their week to admin and manual data entry alone — time not spent selling, and data that often arrives late or incomplete. In a multi-tier organization, that delay compounds at every layer, leading to decisions based on outdated numbers and, ultimately, lost market share and margin.

The bottlenecks that make an immediate solution necessary:

1. Total Data Desynchronization

Without two-way sync between mobile apps and web databases, records fall out of alignment and teams end up doing the same work twice.

2. Operational Stagnation

Without AI-driven route planning built for local terrain and territories, reps end up following inefficient routes, wasting time, fuel, and coverage.

3. Strategic Blindness

Without real-time visibility or forecasting, leadership — from managers to the CEO — ends up reacting to problems instead of getting ahead of them.

4. Loss of Sovereignty

Storing sensitive commercial data on foreign servers adds privacy risk and leaves businesses dependent on infrastructure outside their control.

5. Economic Exclusion

High foreign subscription costs and steep learning curves keep many local startups and SMEs locked out of modern sales technology altogether.

Left unresolved, these problems keep Pakistani businesses paying foreign vendors for tools that don't fit the local market, while running on data they can't fully trust. A secure, homegrown platform gives local industries the real-time intelligence they need to compete on their own terms.

You can read more about the problems of sales management in this digital world and its impact here:

1.4

Objectives:

Our objective is to build the go-to automated backbone for Pakistani sales teams, turning scattered field data into one connected engine for growth. To get there, we're focused on six milestones:

1. Establish Absolute Data Synchronization

Build a two-way sync engine that connects field apps directly to central web databases, so every tier of the organization works from one single source of truth.

2. Automate Strategic Backbone Workflows

Take the admin burden off managers by automating routine sales tasks, reporting cycles, and inventory tracking, freeing them to focus on strategy instead of paperwork.

3. Optimize Operational Intelligence via AI

Use AI-driven analytics and forecasting to turn raw field data into clear, actionable predictions that support smarter planning.

4. Maximize Business ROI through Localized Efficiency

Improve ROI for Pakistani enterprises with top-tier route optimization and tour planning, at a fraction of what foreign alternatives cost.

5. Safeguard National Data Sovereignty

Deliver a secure, locally hosted platform that keeps commercial data within Pakistan, reducing privacy and third-party risk.

6. Catalyze Enterprise Scalability

Build a flexible architecture that lets businesses of any size — from early-stage startups to large, multi-tier distributors — scale up without technical growing pains.

Our aim is to change how sales teams operate in Pakistan — turning sales management from a manual, high-friction chore into a proactive, data-driven engine. With infrastructure that's both intuitive and affordable, local businesses can scale quickly and keep their momentum, without depending on foreign software that doesn't fit their needs.

Section 2

Domain Analysis

2.1

Customer Analysis:

Konvert's success starts with understanding exactly who will use it day to day. Our research points to two core enterprise segments and three distinct user types.

2.1.1

Enterprise Segments:

1. Large-Scale Pharmaceutical and Distribution Enterprises

These organizations run large operations with up to eight layers of management. Their biggest pain point: field data can take days to reach the executive level. Konvert gives these customers one connected environment that closes that gap, so decisions are based on what's happening in the field right now, not last week's reports.

2. Small and Medium Enterprises (SMEs)

SMEs make up most of the Pakistani business landscape, but high costs usually keep them locked out of top-tier sales technology. Konvert gives them a locally built, affordable alternative to global platforms, one that scales with them. For this segment, the biggest win is automation: growing the business without growing the admin workload at the same rate.

2.1.2

User Archetypes:

1. **Executive Leadership**

CEO and C-Suite

Executives need high-level, actionable insight, not raw data. They use Konvert to track national sales trends, compare regional performance, and use AI forecasting to plan expansion. Their goal: protect market share and get the best long-term ROI.

2. **Sales Managers**

Middle Managers

Managers are responsible for their team's productivity. Konvert takes the reporting burden off their plate with automated reports and real-time oversight, so they can spot underperforming routes early and coach their teams with real data.

3. **Field Sales Representatives**

Field Workers

Field reps generate most of the data in the system, so they need a tool that gets out of their way. They use the mobile app for live route tracking, automated tour planning, and inventory management — the value for them is simple: less time on paperwork, more time selling.

2.2

Dependencies and External Systems

Konvert is built on a small set of proven, industry-standard services that provide the specialized capabilities enterprise sales management needs.

1. Centralized Web Infrastructure (Almashreq Soft)

Almashreq Soft's existing web infrastructure serves as the central data source. Konvert connects to it through custom API bridges that pull user hierarchies and push field activity logs to the central servers.

2. Geospatial Services (Google Maps API)

Konvert integrates the Google Maps Platform for geocoding, live rep tracking, and route distance calculations — essential for verifying field attendance and building efficient tour plans.

3. Machine Learning Frameworks

The AI engine is built on Scikit-learn and TensorFlow, two widely trusted machine learning frameworks, to train predictive performance models on historical field data and generate forward-looking sales outlooks.

4. Google Firebase Ecosystem

Konvert runs on Google Firebase for real-time infrastructure: Firestore handles data synchronization, Cloud Messaging (FCM) powers instant notifications, and Firebase Authentication manages secure logins and sessions.

5. Identity and Security Services

Google Authenticator provides multi-factor authentication (MFA), adding an extra layer of protection for executive-level access and sensitive commercial data.

2.3

Related Projects

To see where Konvert fits, we looked closely at what's already serving the market — from legacy regional tools to global enterprise CRMs and specialized pharma field-force platforms.

Regional Industry Leader

SanSFE (Regional Industry Leader)

Widely used across pharmaceutical distribution in South Asia, SanSFE is the legacy baseline many teams already know. It covers basic field reporting, but lacks real-time, two-way sync — data from the mobile app often needs manual reconciliation with central servers, which adds delay and increases errors as it moves up the hierarchy.

Global Enterprise CRM Solutions

Salesforce, HubSpot

These platforms set the global standard for sales management, and specialized players like Veeva Vault CRM and SANEForce serve large pharma organizations directly. But they're a tough fit for the Pakistani SME and distribution market: dollar-based subscription pricing is a real barrier, and their general-purpose design usually needs expensive third-party consultants to adapt to local pharmaceutical or multi-tier distribution workflows.

Smaller competition

Localized Legacy ERPs

Many local enterprises still run on custom-built or older ERP systems. These tend to be desktop-bound or web-only, without the mobile integration field force tracking needs. They work as static record-keeping tools rather than active engines — no geospatial tracking, no AI-driven forecasting to help with route planning or performance.

2.4

Feature Comparison

Feature Attribute	SanSFE (Regional)	Global CRM (Salesforce)	Konvert
Data Sync	Manual reconciliation.	High-speed cloud sync.	Localized bi-directional flow.
Mobile UI	Outdated legacy design.	Modern but complex.	Simplified field-force UX.
Reporting	Static PDF logs.	Advanced BI dashboards.	Automated localized metrics.
Cost	Moderate localized.	Prohibitive dollar-based.	Affordability for local SME.
Visibility	Immediate superior only.	Customizable/Complex.	Native 8-tier hierarchy.
Intelligence	Record-based only.	High-cost AI add-ons.	Built-in native AI engine.
Offline Work	Poor/Unstable.	Basic/Cloud-dependent.	Robust offline-first engine.
Onboarding	Lengthy setup.	Long consultant cycles.	Agile rapid deployment.
Support	Limited regional.	Remote/Indirect.	Direct local engineering.

Section 3

Requirement Analysis

3.1

Functional Requirements

These functional requirements describe what Konvert needs to do to work as a complete sales backbone for your business.

FR Module 1

Initialization, Security, and Access Control

FR-1.	System Startup Checks The app must perform security, stability, and update checks during the splash screen sequence before granting access.
FR-2.	Error Handling and Recovery The system must provide self-healing options (cache clear, database resync, reinstall) in response to runtime errors.

FR-3.	Domain and Hierarchy Onboarding Users must be able to connect to a specific company domain via API keys and retrieve the specific 8-tier hierarchy.
FR-4.	Multi-Factor Authentication (MFA) Login must be secured via Google Authenticator tokens, validated against the Almashreqs database hash.
FR-5.	Feature Locking Mechanism The app must restrict feature access dynamically based on the user's specific role within the retrieved hierarchy.

FR Module 2

Data Synchronization and Persistence

FR-6.	Master Sync Protocol The system must perform a full synchronization with the Almashreq cloud CRM upon login, downloading only data relevant to the specific UserID.
FR-7.	Bi-Directional Real-Time Sync Field data (orders, logs) must sync instantly with Almashreq Database; web-side updates must push to the mobile app immediately.

FR-8.	Offline-First Architecture The app must remain as functional as possible without internet, queueing transactions for automatic upload upon reconnection.
--------------	--

FR Module 3

Intelligent Dashboard and Analytics

FR-9.	AI Performance Prediction The dashboard must display an AI-generated forecast of the user's weekly success probability based on historical behavioral patterns.
FR-10.	Target Visualization Real-time graphs must show daily and weekly target achievement progress derived from the active tour plan.
FR-11.	Automated Notification System A background checker must fetch and display prioritized alerts (warnings, updates, approvals) via a dedicated notification center.

FR-12.	Advanced Reporting Module The system must generate detailed performance reports with granular filtering (daily, weekly, categorical)
---------------	--

FR Module 4

Tour Planning and Roadmap

FR-13.	Automated Tour Plan Creation Users must be able to create new tour plans by selecting dates, routes, and expense budgets.
FR-14.	AI Enhancement ("Enhance Button") The system must offer an AI-helper class to optimize the tour plan for maximum efficiency before submission.
FR-15.	Management Approval Workflow Submitted tour plans must lock upon creation and unlock only after receiving digital approval signals from the management tier.

FR Module 5

Fieldwork and Geospatial Operations

FR-16.	Integrated Route Navigation The fieldwork interface must embed Google Maps to show the route to the next customer without external app switching.
FR-17.	Geo-Fencing Triggers Product selection buttons must only become active when the user's GPS coordinates enter a defined radius of the customer's location.
FR-18.	Quick-Update Mechanism The fieldwork page must allow for rapid, localized data fetching from the server without requiring a full Master Sync.

FR Module 6

Order Management and Booking

FR-19.	Dynamic Product Selection The system must allow users to select OTC and Regular products, applying discounts and bonuses based on current logic.
FR-20.	Daily Booking Summary Users must be able to review, edit, and confirm daily bookings before final submission.

FR-21.	End-of-Day Upload The system must compile all daily bookings and upload them to the Almarshreqs cloud CRM for final administrative approval.
---------------	--

FR Module 7

Tour Plan Builder

FR-22.	Monthly Tour Calendar Users can build a monthly tour plan laid out as 4 weeks of 7 days each, and mark every day as Field Work, Meeting, Off, Remote Field Work, or another approved activity type.
FR-23.	System-Locked Off Days Off days are set by the system according to company policy and cannot be changed by the field user, keeping leave records consistent across the whole team.
FR-24.	Doctor Appointment Scheduling On any day marked as Field Work, users can add doctor appointments with a chosen visit time, so each day starts with a ready-made itinerary.

FR Module 8

Attendance and Field Verification

FR-25.	Daily Geo-Verified Attendance Every field user marks attendance once a day, and the app automatically records the time and GPS location so managers can confirm genuine presence.
FR-26.	Next-Doctor Route Guidance The app identifies the next doctor on the day's plan and shows the live route to that location on the map, helping the rep reach on time.
FR-27.	Visit-Hour and Location Gating A doctor only becomes available to select for a visit once the rep's GPS location matches the clinic and falls within that doctor's visiting hours, so a visit cannot be logged from the wrong place or the wrong time.

FR Module 9

Samples and Digital Detailing

FR-28.	Sample Distribution Log During a doctor visit, users can record which product samples were handed over and in what quantity, keeping a complete, auditable trail of sample usage.
FR-29.	On-Screen Product Showcase Field users can display product images, brochures, and promotional material on-screen during a visit, giving doctors and chemists a polished presentation that supports the sales pitch.

FR Module 10

Team and Territory Collaboration

FR-30.	Joint Field Work A visit can be marked as joint work, pairing the rep with a teammate or manager, with both users' attendance and visit notes captured against the same call for shared accountability and coaching.
FR-31.	Cluster and Territory Management Doctors, chemists, and geographic areas can be grouped into clusters, or territories, and assigned to specific reps or teams on specific time of day (e.g. Morning / Evening), keeping coverage and workload clearly divided across the field force.

FR Module 11

Master Data and Resources

FR-32.	Resource Directory Users can view all resources assigned to them, including samples, promotional material, and budgets, from one central screen.
FR-33.	Doctor and Chemist Database Requests Users can add new doctors and chemists to the shared database, or submit a request to update an existing record, such as a changed clinic address or timing, which an administrator then reviews and approves before it goes live.

FR Module 12

Multi-Tier Management Dashboards

FR-34.	Role-Based Manager Dashboards Beyond the field rep, the system provides its own dashboard and workflow for every management layer — Area Manager, Regional Manager, Zonal Manager, Provincial Manager, and National Sales Manager — each one scoped to the part of the hierarchy that reports to them.
FR-35.	Product and Marketing Manager Dashboards Product Managers and Marketing Managers get dedicated dashboards focused on product performance and promotional content, so they can track how their material performs in the field without needing access to the sales-line hierarchy.

FR Module 13

Communication and Announcements

FR-36.	Company-Wide Announcements Admins and managers can broadcast announcements to a chosen tier or to the entire hierarchy at once, with read confirmation, working alongside the personal alerts already covered under the notification centre.
---------------	---

3.2

Non-Functional Requirements

These non-functional requirements set the quality bar Konvert is built to — how fast, secure, and reliable the platform needs to be.

NFR Module 1

Performance and Efficiency

NFR-1.	Rendering and Sync Speed The Flutter UI must maintain a minimum of 60 FPS for smooth navigation, and the initial Master Sync must complete within 15 seconds on a standard 4G connection.
NFR-2.	Battery Optimization Background services, including continuous 5-minute GPS polling and AI data gathering, must consume less than 15% of device battery over an 8-hour shift.

NFR Module 2

Reliability and Availability

NFR-3.	Offline Resilience The system must guarantee close to zero data loss during network dropouts by utilizing robust local caching before attempting Firebase synchronization.
NFR-4.	High Availability

	The cloud infrastructure and Almashreq API bridges must maintain a minimum 99.5% uptime SLA, in line with industry norms for business-critical platforms, to ensure uninterrupted executive monitoring and data flow.
--	---

NFR Module 3

Security and Compliance

NFR-5.	Encryption Standards All data in transit must be secured via TLS 1.3, and local cache data (like customer PII and bookings) must be encrypted using AES-256.
NFR-6.	Breach Management The system must auto-expire idle sessions and instantly wipe local data while alerting admins if a device security breach or root is detected.

NFR Module 4

Scalability and Maintainability

NFR-7.	Concurrent Architecture The SQL structure and API bridges must be optimized to handle 500+ simultaneous active field agents without write-lock bottlenecks.
---------------	---

NFR-8.	Application Updates The system must support forced mandatory updates and optional delayed updates (1-2 days) to ensure all tiers operate on the same compliant software version.
---------------	--

NFR Module 5

Usability and Compatibility

NFR-9.	Hardware Compatibility The application must operate efficiently on lower-tier mobile devices (minimum 4GB RAM) typically deployed to regional field representatives.
NFR-10.	Human-Centered UX Adhering to ISO 9241-210 standards, core field workflows (check-in, booking) must be achievable within three screen taps to minimize user friction.

3.3

List of Actors

Konvert is designed to serve the following people across your organization:

- Executive Leadership (CEO / Business Unit Head)

- Tactical Managers (National / Provincial / Zonal / Regional / Area)
- Product and Marketing Managers (Cross-Functional)
- Operations Support (Command Center Operatives)
- Field Sales Representatives
- System Administrator
